

SEO AUDIT

E Green Solution egreensolution.in

Detailed technical, on-page, content, local SEO and authority audit

Website	https://www.egreensolution.in/
Audit date	29 September 2026
Scope	19 public pages sampled + local/search presence + official SEO guidance
Prepared as	Actionable remediation report

Overall assessment

The website has a good base: HTTPS, descriptive URLs, crawlable page content, clear services and local targeting. However, the current SEO approach is too aggressive in exact-match keyword repetition and local-page templating, while business identity, factual claims and trust signals are inconsistent. The biggest gains will come from consolidation, evidence-backed content, local entity cleanup, unique case studies and technical verification in Google Search Console.

CONFIDENTIAL WORKING AUDIT

Executive Summary

Priority signal

This is not a “more keywords” problem. The site already uses the target phrases heavily. The main SEO risk is that the same phrases and claims appear across too many pages, while trust, uniqueness and entity consistency are weaker than they should be.

Issue severity snapshot

Critical	High	Medium	Low
3	11	15	6

Top 10 actions to do first

1. Remove the incorrect Income Tax Section 80D solar claim immediately and review every tax/financial incentive statement with a qualified source.
2. Resolve business identity/NAP conflicts across the website, Google Business Profiles, Justdial and the separate egreensolution.co.in presence.
3. Choose one primary URL for “solar company / solar panel installation Pune” and reduce cannibalization between the homepage, /solar-panel-pune, /services, /about and /residential-solar.
4. Rewrite the homepage and local pages to remove unnatural exact-match repetition such as “solar panel pune” and city-list blocks written mainly for rankings.
5. Do not scale more city/area landing pages until each existing page has genuinely unique local proof: project photos, customer story, site specs, permit/net-metering detail, FAQ and service evidence.
6. Add verifiable proof for MNRE/BEE/NISE/ISO/bank partnership/warranty claims, or soften/remove claims that cannot be documented.
7. Turn the Projects page into individual case studies with dates, system size, location, components, generation, savings methodology and customer evidence.
8. Verify robots.txt, XML sitemap, canonical tags, noindex rules, structured data, Core Web Vitals and index coverage in Google Search Console / PageSpeed Insights.
9. Strengthen local authority with one canonical Google Business Profile identity, consistent address/phone data, more genuine reviews and correct location/service-area information.
10. Build a 3-month content cluster around subsidy, net metering, solar cost, residential ROI, industrial EPC, maintenance, panel/inverter comparisons and Pune-specific decision questions.

What is already working

- HTTP/apex variants observed redirect to the preferred HTTPS www version - a good canonical-domain behavior.
- URLs are short, readable and descriptive (for example /residential-solar, /industrial-solar and /solar-panel-chakan).
- The sampled pages expose meaningful HTML text to crawlers rather than hiding the main content entirely behind JavaScript.
- Most sampled pages have distinct visible H1 topics and descriptive image alternative text surfaced by the crawler.
- The site has useful conversion assets: calculator, site-visit CTAs, project gallery, subsidy page and location pages.
- A privacy policy exists and identifies GA4/Google Ads plus lead-handling vendors.

1. Audit Scope & Methodology

Public pages reviewed

URL path	Purpose
/	Homepage
/solar-guide	Solar 101 guide
/services	Services hub
/projects	Projects
/calculator	Solar calculator
/solar-subsidy	Subsidy guide
/areas	Service areas
/about	About
/contact	Contact
/residential-solar	Residential solar
/industrial-solar	Industrial solar
/solar-panel-pune	Pune landing page
/solar-panel-chakan	Chakan
/solar-panel-pimpri-chinchwad	PCMC
/solar-panel-lonavala	Lonavala
/solar-panel-baner-bavdhan	Baner/Bavdhan
/solar-panel-kiwale	Kiwale
/solar-panel-bhosari-pcmc	Bhosari/PCMC
/privacy-policy	Privacy policy

Evidence sources used

- Direct public crawl of egreensolution.in pages and internal links.
- Search-result snapshots for brand and target-keyword visibility.
- Local business search signals and third-party business listings.
- Google Search Central documentation for keyword stuffing, doorway pages, titles, structured data and crawl best practices.
- Official Government of India sources for PM Surya Ghar subsidy and Income Tax Section 80D.

Important limitation

This audit does not have access to Google Search Console, GA4, server logs, CMS/source files or a live Lighthouse/PageSpeed run. Therefore, exact Core Web Vitals, crawl-error counts, backlink totals, canonical implementation, robots/sitemap contents and index coverage are listed as verification items rather than fabricated metrics.

2. Critical Findings

CRITICAL #1

Incorrect tax statement: Section 80D is presented as a solar tax benefit

Evidence: The homepage FAQ says residential solar receives “tax benefits under 80D.” India's Income Tax Department defines Section 80D as a deduction for health insurance premiums / preventive health check-ups, not rooftop solar. [W1][O1]

Why it matters: Incorrect financial information can damage user trust, conversion quality and perceived expertise. It can also create legal/compliance risk.

Recommended fix: Delete the 80D claim. Keep residential subsidy information separate from tax claims. Have commercial depreciation/tax language reviewed by a CA and cite the applicable rule/year.

Sources: W1, O1

CRITICAL #2

Business identity / NAP fragmentation across the web

Evidence: The website lists multiple Pune addresses plus Baramati; local search surfaces two similarly named business profiles in Dhankawadi with different addresses. Justdial lists another address/GST identity, while egreensolution.co.in uses the same Hira Banglow address but a different phone/GST. [W9][W19][D1][D2]

Why it matters: Local SEO depends on a clear entity. Conflicting names, addresses, phone numbers, websites and legal details can split reviews/citations and weaken map-pack confidence.

Recommended fix: Create one canonical NAP sheet. Decide which legal entity/domain/profile is primary. Merge/remove duplicates where possible; update all directories; use consistent business name, primary phone, address and website everywhere. If .co.in is a separate entity, differentiate the legal name/brand/address clearly.

Sources: W9, W19, D1, D2

CRITICAL #3

Doorway-page and keyword-stuffing risk in local SEO strategy

Evidence: The homepage contains a very large block of Pune/PCMC locality names and repeated exact-match phrases. The location pages follow a highly similar formula with phrases such as “best solar installers [area]” and repeated city terms. Google explicitly lists city/region pages that funnel users and unnatural keyword repetition as doorway/keyword-stuffing risks. [W1][W12-W18][G1]

Why it matters: If the pages are judged as substantially similar pages built mainly to rank for local queries, rankings can be suppressed and future local-page expansion can become a liability.

Recommended fix: Stop creating more area pages until the template is redesigned. Keep only locations with real operations/proof. Add unique projects, local testimonials, original photos, permits/net-metering detail, local FAQs, service constraints and genuinely distinct content. Remove city-name lists written primarily for search engines.

Sources: W1, W12-W18, G1

3. High-Priority Findings

HIGH #4	Keyword cannibalization across core Pune pages Evidence: The homepage, /services, /solar-panel-pune, /residential-solar and /about repeatedly target “best solar company in Pune,” “solar panel Pune,” “solar panel installations in Pune” and “solar panel price in Pune.” [W1][W2][W8][W10][W12] Why it matters: Multiple URLs can compete for the same intent, making it harder for search engines to decide which page should rank and weakening relevance signals. Recommended fix: Define a keyword-to-URL map. Make the homepage the primary broad “solar company in Pune / solar installation Pune” page. Keep residential and industrial pages tightly intent-specific. Either merge /solar-panel-pune into the homepage with a 301 or reposition it as a genuinely informational Pune solar cost/process guide. Sources: W12
HIGH #5	Unnatural exact-match copy reduces quality and trust Evidence: Many paragraphs use phrases such as “solar panel pune,” “best solar installers bavidhan trust,” “solar panel installations in pune” and “life bill zero” in unnatural grammar. [W1][W2][W14-W18] Why it matters: Google recommends natural, people-first language and explicitly warns against excessive repetition. The copy also looks machine-generated and weakens brand credibility. Recommended fix: Rewrite for humans first. Use natural variants: rooftop solar, residential solar, solar EPC, Pune solar installer, commercial PV. Mention a location only when it adds useful context. Sources: W14-W18
HIGH #6	Local landing pages lack enough unique local evidence Evidence: Most area pages change the locality, audience and a few environmental details but use the same structure: local intro, price/ROI paragraph, engineering paragraph, net-metering paragraph, bullets, form and generic footer. [W13-W18] Why it matters: Template similarity makes pages less defensible as standalone search results and increases doorway/scaled-content risk. Recommended fix: For every retained location page add at least one named local installation, original photo set, project size/date, local customer quote, map/service radius, local MSDCL experience, unique FAQ and location-specific constraints. Sources: W13-W18
HIGH #7	Contradictory ROI/payback statements Evidence: The Solar 101 page says payback is 6-8 years, then says the initial investment is recovered “usually in 4 years.” The homepage says 4-6 years with subsidies and 6-8 without, while some local/industrial pages use under-5-year or 3.5-4.5-year claims. [W1][W3][W13][W18] Why it matters: Inconsistent financial promises are a trust problem and may create low-quality leads who expect a guaranteed payback. Recommended fix: Create one documented ROI methodology with assumptions: tariff, annual generation/kW, degradation, subsidy eligibility, capex, O&M and tax status. Label all examples “illustrative” and show date/assumptions. Sources: W18
HIGH #8	Certification, approval and partnership claims are not substantiated on-page Evidence: The site claims MNRE approval, BEE certification, NISE-certified engineers, ISO certification, HDFC/ICICI partnerships and other credentials, but the audited pages do not show certificate numbers, links or evidence. [W1][W8] Why it matters: Unsupported authority claims weaken E-E-A-T and can create reputational risk if users try to verify them. Recommended fix: Create a Credentials page. Show legal entity name, GST/CIN if applicable, empanelment/vendor ID, ISO certificate, engineer credentials, manufacturer authorization and financing-partner documentation. Link claims to proof. Sources: W8

HIGH
#9**Projects page is too thin for the site's strongest proof asset**

Evidence: The Projects page mostly lists client/project names and kW values. It lacks individual case-study pages with commissioning date, design, production, savings, ROI, equipment, challenges and customer evidence. [W4]

Why it matters: Case studies can rank for long-tail industrial/location searches and provide strong expertise/experience signals. The current gallery leaves this SEO value unused.

Recommended fix: Create one indexable case study per major project. Include original photos, system specs, client sector, location, before/after bill data where permitted, generation methodology, quote/testimonial and internal links to the relevant service/location page.

Sources: W4

HIGH
#10**Review authority is weak and fragmented**

Evidence: A surfaced local-business result for the primary address shows only a few reviews, while a second similar-name profile also appears. Third-party Pune solar directories show competitors with materially larger review counts. [D1][C1]

Why it matters: Reviews affect local conversion and are an important real-world trust signal. Fragmented profiles can split review equity.

Recommended fix: Consolidate the correct GBP, then build a compliant post-install review process. Ask every completed customer for a genuine review; respond to all reviews; add review links to completion emails/WhatsApp; never buy or gate reviews.

Sources: C1

HIGH
#11**Brand/domain ambiguity with egreensolution.co.in**

Evidence: Search results surface egreensolution.co.in for an "Egreen Solution" at the same Hira Banglow address, but with different contact/legal details. [D2]

Why it matters: Users and search engines may confuse the entities; backlinks and citations may point to the wrong domain, and brand queries can be cannibalized.

Recommended fix: Confirm ownership. If same company, choose a canonical primary domain and permanently redirect/align the secondary site where feasible. If different, make legal/brand distinctions explicit and prevent cross-citation confusion.

Sources: D2

HIGH
#12**No visible editorial content engine for topical authority**

Evidence: Aside from Solar 101, subsidy, calculator and local pages, the main navigation does not expose a blog/resources hub with fresh expert content. [W1-W8]

Why it matters: Competitors can win long-tail demand with up-to-date guides on cost, subsidy, net metering, panel technology, maintenance and industrial policy.

Recommended fix: Launch a Resources hub with named authors/reviewers and update dates. Publish fewer, deeper pieces rather than many thin SEO posts.

Sources: W1-W8

HIGH
#13**Homepage content is bloated and repeats sections/claims**

Evidence: The homepage contains long sections for price, installations, FAQs, success map, city lists and another large Pune coverage block after already covering similar themes earlier. [W1]

Why it matters: Content bloat hurts scanability and can dilute the main conversion path. Heavy interactive sections also increase performance risk.

Recommended fix: Reduce the homepage to core intent: value proposition, services, proof, process, key project evidence, concise FAQ and CTA. Move deep pricing/subsidy/local detail to dedicated pages and link contextually.

Sources: W1

HIGH
#14**Performance/Core Web Vitals risk from heavy interactive and third-party elements**

Evidence: The site uses interactive before/after elements, component hotspots, calculators, videos, a Google map iframe and a visible hits.sh traffic counter across multiple pages. [W1][W2][W4][W5][W9]

Why it matters: These can increase JavaScript, image/video weight and third-party requests, affecting LCP/INP/CLS - especially on mobile. Exact CWV was not measurable in this audit.

Recommended fix: Run PageSpeed Insights on homepage, services, residential, industrial, one location page and contact. Compress/resize images, lazy-load below-the-fold media/maps, defer noncritical JS, remove the public traffic counter and optimize video delivery.

Sources: W9

4. Medium-Priority Findings

MEDIUM #15	Promotional title language (“Best”, “#1”) is overused Evidence: The homepage title is “Best Solar Dealers Pune #1 Solar Company E Green Solution”; multiple page titles and H1 copy use “Best/Leading/Premier.” [W1][W2][W12-W18] Why it matters: Titles should describe the page clearly; repeated superlatives without proof can lower click trust and make titles look templated. Recommended fix: Use factual, intent-focused titles. Keep the brand at the end. Reserve superlatives for verifiable third-party awards or evidence. Sources: W12-W18
MEDIUM #16	Sitewide exact-match footer tagline creates boilerplate repetition Evidence: Many pages repeat the same footer sentence: “E Green Solution is the leading solar panel pune expert...” [W1-W18] Why it matters: Large repeated boilerplate adds little unique value and reinforces keyword-stuffing signals. Recommended fix: Replace with a natural short brand description once in the footer, without exact-match keyword repetition. Sources: W1-W18
MEDIUM #17	Heading hierarchy and duplicate section labels need cleanup Evidence: The homepage includes an H2 “2MW+” followed by another H2; the services page repeats installation-process sections; the contact page has “Send Us a Message” twice. [W1][W2][W9] Why it matters: Clean semantic structure improves accessibility, scanning and content understanding. Recommended fix: Use one descriptive H1, logical H2/H3 nesting, and remove duplicate section headings. Make metric callouts non-heading text unless they introduce a section. Sources: W9
MEDIUM #18	Important factual claims lack citations or methodology Evidence: Examples include property value increase “up to 15%,” 300+ sunny days, 90% bill savings, “20% more efficiency,” 100% MSSEDCL success rate and 10,000+ tons of CO2 reduction annually. [W1][W8][W12] Why it matters: Claims are central to purchase decisions. Unsupported numbers can undermine trust and invite challenge. Recommended fix: Add source/date/methodology next to factual claims. Remove “100%” or “guarantee” language unless contractually true and documented. Sources: W12
MEDIUM #19	CO2 claim appears inconsistent with the stated installed capacity Evidence: The About page says 2MW+ installed and also says the company is reducing 10,000+ tons of CO2 annually. [W8] Why it matters: At typical rooftop-solar generation and grid-emission assumptions, 2MW would not normally support a 10,000 tCO2/year claim. The numbers therefore need reconciliation. Recommended fix: Calculate emissions using a documented annual generation value and an official/reputable grid emission factor. State whether the figure is annual or cumulative and update both capacity and impact figures together. Sources: W8
MEDIUM #20	“Live output” number lacks context Evidence: The homepage displays “4,280 W Live Output” without identifying which system, data source, refresh time or whether it is demo data. [W1] Why it matters: Ambiguous live metrics can appear artificial and reduce trust. Recommended fix: Either connect it to a real monitored installation and label the project/timestamp, or change it to a clearly labeled example/demo. Sources: W1

MEDIUM
#21

Service-page coverage is incomplete for offered products

Evidence: Services lists solar water heating, street lights and solar water pumps, but the audited internal architecture prominently links only residential and industrial solar service pages. [W2]

Why it matters: High-intent service searches for water heaters, pumps and lighting have no strong dedicated landing page in the sampled navigation.

Recommended fix: Create distinct service pages only where the business actively sells/install the service. Include specs, applications, proof, FAQs, locations and project evidence.

Sources: W2

MEDIUM
#22

Internal linking is navigation-heavy rather than context-rich

Evidence: Most pages rely on the same header/footer links. Local pages rarely link contextually to a relevant case study, subsidy explanation, calculator or service detail. [W10-W18]

Why it matters: Contextual links help users and search engines understand topic relationships and pass relevance more intentionally.

Recommended fix: Add in-body links: location -> local case study -> service -> subsidy/calculator; service -> project examples -> relevant areas. Use natural anchor text.

Sources: W10-W18

MEDIUM
#23

Breadcrumbs are not visible in the sampled rendered content

Evidence: The sampled pages show header navigation but no visible breadcrumb trail. [W2-W18]

Why it matters: Breadcrumbs improve orientation and can clarify hierarchy for location/service pages.

Recommended fix: Add visible breadcrumbs and BreadcrumbList structured data on internal pages, especially /areas/*-style content and services/case studies.

Sources: W2-W18

MEDIUM
#24

Structured data needs formal validation

Evidence: The rendered crawl does not expose enough source-level information to verify Organization/LocalBusiness, BreadcrumbList or other JSON-LD. [G3]

Why it matters: Correct structured data can clarify business identity and page hierarchy; incorrect markup can create Search Console errors.

Recommended fix: Validate homepage/contact LocalBusiness + Organization, internal BreadcrumbList and any appropriate service/video markup with Google Rich Results Test and Search Console. Do not add review markup for self-serving local-business reviews.

Sources: G3

MEDIUM
#25

Robots.txt, XML sitemap, canonicals and meta robots need verification

Evidence: The public audit fetcher could not validate robots.txt or sitemap endpoints; source-level canonical/meta-robots data was also unavailable.

Why it matters: A hidden noindex, missing canonical or sitemap issue can undermine the entire content strategy even if pages look fine in a browser.

Recommended fix: Verify /robots.txt and XML sitemap in browser and Search Console; ensure only canonical 200 URLs are submitted; inspect canonical, robots and status codes for every indexable template.

MEDIUM
#26

No measured Core Web Vitals / mobile performance baseline

Evidence: No reliable PageSpeed/CrUX dataset was available in this audit environment.

Why it matters: Without a baseline, performance fixes cannot be prioritized by real LCP, INP and CLS data.

Recommended fix: Capture mobile and desktop PSI for 6 representative pages and export GSC Core Web Vitals. Set targets and re-test after each release.

MEDIUM
#27

Forms collect leads without visible consent microcopy next to the submit action

Evidence: Homepage/contact/location forms collect names, phones, city and electricity-bill data; the privacy policy exists, but the sampled form text does not show a nearby consent/privacy link. [W1][W9][W19]

Why it matters: Clear consent language increases trust and reduces friction/complaints, especially when users may receive WhatsApp/phone follow-up.

Recommended fix: Add a short consent line with a privacy-policy link and explain expected contact channels. Align implementation with applicable privacy requirements.

Sources: W19

**MEDIUM
#28****Financial/subsidy pages lack visible author/reviewer credentials**

Evidence: The subsidy, calculator and solar-guide pages present financial assumptions but the rendered pages do not show an expert author/reviewer or update methodology. [W3][W5][W6]

Why it matters: For money-related decisions, visible expertise and freshness improve user confidence.

Recommended fix: Add “Reviewed by” credentials, last-updated date, source links and assumption notes to subsidy/ROI content.

Sources: W6

**MEDIUM
#29****About page uses stock imagery where authentic proof would be stronger**

Evidence: The About page includes an Unsplash-hosted “Solar Engineering” image. [W8]

Why it matters: A local contractor gains more trust from authentic team, office and project imagery than generic stock photos.

Recommended fix: Replace stock imagery with real engineers, safety practices, office/workshop, commissioning and customer sites; add descriptive alt text.

Sources: W8

5. Additional Findings

MEDIUM #30	Video content lacks strong crawlable support text Evidence: The Projects page exposes video elements but the crawler only receives “Your browser does not support the video tag.” [W4] Why it matters: Important project proof may be invisible to users/crawlers who cannot play the video and cannot contribute much textual relevance. Recommended fix: Add poster images, captions, short transcript/summary, project context and VideoObject markup where appropriate. Sources: W4
MEDIUM #31	Testimonials and proof are underused on commercial pages Evidence: The homepage shows client names and project cards but not detailed testimonials, review snippets or proof tied to services. [W1][W4] Why it matters: Buyers of high-ticket solar installations need social proof before submitting a lead. Recommended fix: Add verified customer quotes with project details and permission. Link to full case studies and third-party review profiles. Sources: W4
LOW #32	“Reply in <15 mins” conflicts with “within 24 hours” Evidence: The Contact page promises “Reply in: < 15 Mins” near the top and later says experts will get back within 24 hours. [W9] Why it matters: Conflicting service-level promises can disappoint leads and look unreliable. Recommended fix: Use one realistic response commitment and make it operationally true. Sources: W9
LOW #33	Visible hits.sh “Website Traffic” counter is unnecessary Evidence: Several pages expose a “Website Traffic” image from hits.sh in the footer. [W1][W2][W4][W5][W8][W9] Why it matters: It adds a third-party request, looks dated and does not help users or SEO. Recommended fix: Remove the public counter. Use GA4/Search Console privately for analytics. Sources: W9
LOW #34	Brand and grammar consistency needs editorial cleanup Evidence: The site alternates “E Green Solution,” “Egreen Solution,” “Egreen solution”; copy includes phrases such as “life bill zero,” inconsistent lowercase “pune,” and “Designed with for a greener future.” [W1][W2][W8] Why it matters: Copy quality is a trust signal, especially for engineering and financial services. Recommended fix: Create a brand/editorial style guide and proofread every page. Standardize brand spelling, capitalization, units (kW/kWh/MW), warranty terms and terminology. Sources: W8
LOW #35	Some local-page titles are boilerplate rather than intent-led Evidence: Examples include “Solar Panel Dealers PCMC Expert Service” and “Solar Panels Baner & Bavdhan Home.” [W14][W16] Why it matters: Generic suffixes waste title space and do not communicate the service differentiator. Recommended fix: Use location + service + relevant intent, e.g. “Solar Panel Installation in PCMC Rooftop & Society Solar E Green Solution.” Sources: W16

6. Keyword & Page Cannibalization Map

Recommended architecture principle

One primary intent = one primary URL. Supporting pages should cover distinct sub-intents and link back to the primary page, rather than repeating the same “best solar company in Pune / solar panel Pune” language everywhere.

Page	Primary intent	Action	Notes
Homepage /	solar company in Pune; solar installation Pune	Keep as primary broad commercial page	Rewrite around company + residential/commercial/industrial overview; reduce price/locality stuffing.
/residential-solar	residential solar Pune; rooftop solar for home	Keep	Own residential intent, subsidy, home-size examples, society/bungalow proof.
/industrial-solar	industrial solar Pune; factory solar EPC	Keep	Own C&I EPC intent; add compliance, engineering, O&M and industrial case studies.
/services	solar services Pune	Keep as hub	Short service directory; avoid trying to rank for every main keyword.
/solar-panel-pune	currently overlaps homepage	Merge or repurpose	Preferred: 301 into homepage if no distinct purpose; alternative: turn into a detailed Pune cost/process guide targeting informational intent.
/solar-subsidy	PM Surya Ghar subsidy Pune	Keep	Evidence-led eligibility/process guide with official sources and update date.
/calculator	solar savings calculator Pune	Keep	Utility intent; publish assumptions and methodology.
/solar-guide	solar basics / solar guide Pune	Keep	Educational hub; expand into topic cluster with expert review.
/areas	solar service areas Pune/PCMC	Keep as location hub	Link only to genuinely useful location pages.
Location pages	solar installer + locality	Keep selectively	Retain only areas with unique proof. Avoid scaling thin variants.
Case studies	project/client/location long-tail	Create	Individual project proof pages should become a major authority layer.

7. Priority Title & Snippet Recommendations

Google recommends descriptive, concise, distinct titles and warns against keyword-stuffed or repeated boilerplate titles. [G2] The current titles are mostly unique, but several rely too heavily on “Best/#1” positioning rather than intent.

URL	Suggested title	Suggested meta description
/	Solar Company in Pune Rooftop Solar E Green Solution	Residential, commercial and industrial solar installation in Pune. Get a site survey, subsidy guidance, net-metering support and project-backed recommendations.
/residential-solar	Residential Rooftop Solar Pune E Green Solution	Home rooftop solar installation in Pune with PM Surya Ghar guidance, system sizing, net metering and transparent savings estimates.
/industrial-solar	Industrial Solar EPC Pune E Green Solution	Industrial rooftop solar EPC for Pune and MIDC facilities, including engineering, approvals, monitoring and project execution.
/solar-subsidy	PM Surya Ghar Subsidy Pune 2026 E Green Solution	Check current PM Surya Ghar subsidy amounts, eligibility, application steps and required documents for residential rooftop solar in Pune.
/solar-panel-chakan	Solar Panel Installation Chakan MIDC E Green Solution	Solar EPC for Chakan MIDC factories and warehouses with engineering, approvals, monitoring and local project experience.
/solar-panel-pimpri-chinchwad	Solar Panel Installation in PCMC E Green Solution	Rooftop solar for PCMC homes, societies and businesses with system sizing, subsidy/net-metering support and local service.

8. Content & E-E-A-T Upgrade Plan

A. Build proof before publishing more SEO pages

- Create a Credentials & Compliance page with verifiable documents/IDs.
- Create a proper Project Case Studies section. Prioritize Eagle Burgmann, Bhagawati Industries, Kotling Enterprises, residential Pune and a society/PCMC project.
- Use original site photos with dates/locations (with customer permission) instead of stock imagery.
- Add real team profiles: engineer names, qualifications, responsibilities and experience.
- Add a consistent methodology box to every price/savings/ROI page.

B. Suggested 90-day content cluster

Cluster	Recommended article/page
Commercial intent	Solar panel installation cost in Pune 2026: 1kW/3kW/5kW with assumptions
Subsidy	PM Surya Ghar Pune: eligibility, documents, vendor selection and MSEDCL workflow
Net metering	MSEDCL rooftop solar net metering: step-by-step, timelines and common rejection reasons
Residential	3kW vs 5kW home solar in Pune: bill, roof area and payback comparison
Industrial	Industrial rooftop solar in Chakan/Bhosari: design, CEIG/MSEDCL, tax review and O&M
Technical	Vikram Solar 550W vs 600W: when panel wattage matters and when it does not
Maintenance	Solar panel cleaning and AMC in Pune: monsoon, dust, inspection schedule
Case study	200kW industrial rooftop case study: design, generation, savings and lessons
Societies	Housing-society rooftop solar in Pune/PCMC: common-meter loads, approvals and economics
Buyer guide	How to compare solar quotations: panel, inverter, BOS, warranty, structure and exclusions

C. Content quality rules

- No claim without a source, contract term or transparent calculation.
- No city/location page without unique first-hand evidence.
- No “best/#1/leading” claim unless a named independent source supports it.
- Use dates on subsidy, tariff, price and policy content; update or archive stale statements.
- Keep language natural. Do not force the same exact keyword into every paragraph and heading.
- Use expert review for tax, policy, subsidy and industrial-compliance statements.

9. Local SEO Remediation

Canonical NAP worksheet

Choose one canonical version and use it consistently across the main website, Google Business Profile, Maps, Justdial, manufacturer/installer directories, social profiles, invoices and local citations.

- Business name: decide “E Green Solution” vs “Egreen Solution” and use the same form everywhere.
- Primary address: decide whether the Hira Banglow office is the primary public location and whether other addresses are staffed customer-facing locations or service areas.
- Primary phone: use one main number consistently; secondary numbers can be listed as additional contacts but should not replace the canonical number randomly.
- Website: choose the primary domain and avoid two near-identical brands/domains competing for the same entity.
- Legal details: show the correct GST/legal business identity on the website and ensure directory listings match it.
- Opening hours: align website/profile hours and holiday updates.

Google Business Profile priorities

- Audit and merge/close duplicate profiles where permitted.
- Use the correct primary category (solar energy company / solar installer as appropriate) and only relevant secondary categories.
- Add services, service areas, products where useful, photos of real projects, team and office.
- Post project updates and educational posts periodically; keep photos geolocationally relevant without keyword-stuffing filenames/captions.
- Create a review request SOP triggered after commissioning and after successful service visits.
- Respond to every review naturally; do not paste the same keyword-rich response.

Local ranking opportunity

The site already has strong Pune-specific service language. The bigger opportunity is not adding more locality names - it is strengthening the real-world entity: one business identity, strong reviews, authentic projects, correct listings and locally specific proof.

10. Technical SEO Verification Checklist

Check	Status	Required action
Robots.txt	Must verify	Confirm 200 response, no accidental Disallow on assets/pages, add sitemap reference.
XML sitemap	Must verify	Only canonical 200 indexable URLs; submit in Search Console.
Canonical tags	Must verify	Self-referencing canonicals on indexable pages; no cross-canonical mistakes.
Meta robots	Must verify	No accidental noindex/nofollow on money pages.
HTTP -> HTTPS / apex -> www	Observed good	Redirects to https://www.egreensolution.in/ were observed.
404/redirect chains	Must crawl	Run Screaming Frog/Sitebulb; fix broken internal links and chains.
Core Web Vitals	Must measure	PSI + GSC mobile LCP/INP/CLS on representative templates.
Image optimization	Must inspect	Modern formats, explicit width/height, responsive srcset, lazy loading below fold.
Video optimization	Needs work	Poster, lazy loading, captions/transcript, compressed streaming.
Structured data	Must validate	Organization/LocalBusiness, BreadcrumbList; validate errors in Search Console.
Mobile UX	Must test	Tap targets, sticky CTAs, forms, sliders, calculator and menu on low-end Android.
Index coverage	Must verify	Review Crawled/Discovered - currently not indexed, duplicates, soft 404s.
Server logs	Optional advanced	Check Googlebot crawl distribution and wasted crawling if site grows.
Security headers	Optional	Check HSTS/CSP/X-Content-Type-Options as part of technical hygiene.

11. 90-Day SEO Action Roadmap

Timeline	Focus	Deliverables
Days 0-7	Risk cleanup	Remove 80D error; audit every financial/certification claim; decide canonical NAP/domain/GBP; stop publishing new locality pages; verify robots/sitemap/canonicals/noindex in GSC.
Days 8-21	Architecture & copy	Create keyword map; decide fate of /solar-panel-pune; rewrite homepage/services/local templates; clean headings/footer; create credentials page; add consent microcopy. Publish 3-5 full case studies; replace stock images with real photos; implement/validate LocalBusiness + BreadcrumbList; run CWV fixes; remove hits.sh; optimize map/video/media.
Days 22-45	Proof & technical	Publish 4-6 expert-reviewed resource pages focused on cost, subsidy, net metering, residential sizing and industrial EPC; add strong internal links.
Days 46-75	Topical authority	Review-generation campaign; citation cleanup; manufacturer/association links; local PR/project coverage; monitor GSC queries and consolidate pages that compete with each other.
Days 76-90	Authority & local growth	

KPIs to monitor after fixes

- Search Console: non-brand clicks/impressions by page and query.
- Cannibalization: number of queries where 2+ URLs swap/compete for the same intent.
- Local: GBP calls, website clicks, direction requests, review count/rating and duplicate-profile resolution.
- Conversion: qualified leads by landing page, form completion rate, phone/WhatsApp conversion.
- Technical: indexed canonical URLs, sitemap errors, CWV pass rate, 404/redirect errors.
- Content: case-study and resource pages earning impressions, links and assisted conversions.

Interpretation note

Search-result and local-listing data are snapshots and can change. The recommended fixes do not depend on exact rank positions; they address durable issues observed in the site's content, architecture, entity consistency and trust signals.

Note: Character count is only a diagnostic. Google truncates titles primarily by available display width, not a fixed character rule. The stronger issue here is promotional/boilerplate wording, not length alone.
